Profit decline: The two main drivers are high discounting and return-related losses, which reduce profit margin and increase costs.

Region/Channel: The Region × Channel with the highest Return Rate and Return Loss should be fixed first because it has the biggest negative impact on profit.

Actions: Reduce excessive discounts, lower returns in the worst-performing Region/Channel, and improve shipping efficiency. KPIs should be Profit Margin %, Return Rate %, Return Loss, Shipping Cost %, and Delivery Days.

Limitations: The data shows what happened but does not fully explain why customers returned products, why delivery was delayed, or why customers responded to discounts; additional customer and operational data would be needed.

PCA provides a clear overall separation of the classes, while t-SNE and UMAP generally produce more distinct clusters. Among the three methods, the method with the clearest separation of the three classes gives the best visualization of the data.
